

THE ALPERIN WEIGHT CONJECTURE
AND UNO'S CONJECTURE
FOR THE BABY MONSTER \mathbb{B} , p ODD

JIANBEI AN AND R. A. WILSON

Abstract

Suppose that p is 3, 5 or 7. In this paper, faithful permutation representations of maximal p -local subgroups are constructed, and the radical p -chains of the Baby Monster \mathbb{B} are classified. Hence, the Alperin weight conjecture and the Uno reductive conjecture can be verified for \mathbb{B} , the latter being a refinement of Dade's reductive conjecture and the Isaacs–Navarro conjecture.

1. *Introduction*

Recently, Isaacs and Navarro [12] proposed a new conjecture that is a refinement of the Alperin–McKay conjecture, and Uno [15] raised an alternating sum version of the conjecture that is a refinement of the Dade conjecture [9].

Dade's reductive conjecture [9] has been verified for all of the sporadic simple groups except Fi'_{24} , \mathbb{B} and \mathbb{M} . The use of computer algebra systems, (namely MAGMA [6] and GAP [10]) to study permutation (or in some cases matrix) representations of the groups has been a central step of the program. Since the smallest faithful permutation representation of \mathbb{B} has degree 13 571 955 000, it is difficult to verify the conjecture directly. However, from the classification [16] of maximal p -local subgroups of \mathbb{B} , we know that when p is equal to 3, 5 or 7, the normalizer of each radical p -subgroup of \mathbb{B} is a subgroup of one of precisely thirteen maximal p -local subgroups. Thus we can classify radical chains in these maximal subgroups without performing any calculation in \mathbb{B} .

In this paper, we construct a faithful permutation representation for each maximal p -local subgroup. We then classify radical chains, and hence verify the Alperin weight conjecture and Uno's refinement of Dade's reductive conjecture for \mathbb{B} .

The paper is organized as follows. In Section 2, we fix the notation, state the conjectures in detail, and state three lemmas. In Section 3, we explain how to construct faithful permutation representations of the thirteen maximal p -local subgroups. In Section 4, we recall the modified local strategy [4, 5]; we also explain how we applied it to determine the radical subgroups of each maximal subgroup, and how to determine the fusion of the radical subgroups in \mathbb{B} . In Section 5, we classify radical p -subgroups of \mathbb{B} , and verify the Alperin weight conjecture. In Section 6, we do some cancellations in the alternating sum of Uno's conjecture, and then determine radical chains (up to conjugacy) and their local structures. In the last section, we verify Uno's projective conjecture for \mathbb{B} .

2. Conjectures and lemmas

Let p be a prime and R a p -subgroup of a finite group G . Then R is *radical* if $O_p(N(R)) = R$, where $O_p(N(R))$ is the largest normal p -subgroup of the normalizer $N(R) = N_G(R)$. Denote by $\text{Irr}(G)$ the set of all irreducible ordinary characters of G , and let $\text{Blk}(G)$ be the set of p -blocks, $B \in \text{Blk}(G)$ and $\varphi \in \text{Irr}(N(R)/R)$. The pair (R, φ) is called a B -weight if $d(\varphi) = 0$ and $B(\varphi)^G = B$ (in the sense of Brauer), where $d(\varphi) = \log_p(|G|_p) - \log_p(\varphi(1)_p)$ is the p -defect of φ and $B(\varphi)$ is the block of $N(R)$ containing φ . A weight is always identified with its G -conjugates. Let $\mathcal{W}(B)$ be the number of B -weights, and let $\ell(B)$ be the number of irreducible Brauer characters of B . Alperin [1] conjectured that $\mathcal{W}(B) = \ell(B)$ for each $B \in \text{Blk}(G)$.

Given a p -subgroup chain

$$C : P_0 < P_1 < \dots < P_n \tag{2.1}$$

of G , define $|C| = n$, $C_k : P_0 < P_1 < \dots < P_k$, and

$$N(C) = N_G(C) = N(P_0) \cap N(P_1) \cap \dots \cap N(P_n). \tag{2.2}$$

The chain C is said to be *radical* if it satisfies the following two conditions:

- (a) $P_0 = O_p(G)$, and
- (b) $P_k = O_p(N(C_k))$ for $1 \leq k \leq n$.

Denote by $\mathcal{R} = \mathcal{R}(G)$ the set of all radical p -chains of G . Let $B \in \text{Blk}(G)$, and let $D(B)$ be a defect group of B . The p -local rank (see [2]) of B is the number

$$\text{plr}(B) = \max\{|C| : C \in \mathcal{R}, C : P_0 < P_1 < \dots < P_n \leq D(B)\}.$$

Let Z be a cyclic group, $\hat{G} = Z.G$ a central extension of Z by G , and $C \in \mathcal{R}(G)$. Denote by $N_{\hat{G}}(C)$ the preimage $\eta^{-1}(N(C))$ of $N(C)$ in \hat{G} , where η is the natural group homomorphism from \hat{G} onto G with kernel Z . Let ρ be a faithful linear character of Z , and let \hat{B} be a block of \hat{G} covering the block $B(\rho)$ of Z containing ρ . Denote by $\text{Irr}(N_{\hat{G}}(C), \hat{B}, d, \rho)$ the irreducible characters ψ of $N_{\hat{G}}(C)$ such that ψ lies over ρ , $d(\psi) = d$ and $B(\psi)^{\hat{G}} = \hat{B}$, and set $k(N_{\hat{G}}(C), \hat{B}, d, \rho) = |\text{Irr}(N_{\hat{G}}(C), \hat{B}, d, \rho)|$.

DADE'S PROJECTIVE CONJECTURE (see [9]). *If $O_p(G) = 1$ and \hat{B} is a p -block of \hat{G} covering $B(\rho)$ with defect group $D(\hat{B}) \neq O_p(Z)$, then*

$$\sum_{C \in \mathcal{R}/G} (-1)^{|C|} k(N_{\hat{G}}(C), \hat{B}, d, \rho) = 0, \tag{2.3}$$

where \mathcal{R}/G is a set of representatives for the G -orbits of \mathcal{R} .

If $Z = 1$, then $\hat{G} = G$, $\hat{B} = B$ and $\rho = 1$. Set $k(N(C), B, d) = k(N_{\hat{G}}(C), \hat{B}, d, \rho)$. The *projective conjecture* is then called the *ordinary conjecture*.

DADE'S ORDINARY CONJECTURE (see [8]). *If $O_p(G) = 1$ and B is a p -block of G with defect group $D(B) \neq 1$, then for any integer $d \geq 0$,*

$$\sum_{C \in \mathcal{R}/G} (-1)^{|C|} k(N(C), B, d) = 0.$$

Let \hat{H} be a subgroup of a finite group \hat{G} , let $\varphi \in \text{Irr}(\hat{H})$ and let $r(\varphi) = r_p(\varphi)$ be the integer $0 < r(\varphi) \leq (p-1)$ such that the p' -part $(|\hat{H}|/\varphi(1))_{p'}$ of $|\hat{H}|/\varphi(1)$ satisfies

$$\left(\frac{|\hat{H}|}{\varphi(1)} \right)_{p'} \equiv r(\varphi) \pmod{p}.$$

Given an integer $1 \leq r \leq (p-1)/2$, let $\text{Irr}(\hat{H}, [r])$ be the subset of $\text{Irr}(\hat{H})$ consisting of characters φ such that $r(\varphi) \equiv \pm r \pmod{p}$, and let

$$\begin{aligned} \text{Irr}(\hat{H}, \hat{B}, d, \rho, [r]) &= \text{Irr}(\hat{H}, \hat{B}, d, \rho) \cap \text{Irr}(\hat{H}, [r]); \\ k(\hat{H}, \hat{B}, d, \rho, [r]) &= |\text{Irr}(\hat{H}, \hat{B}, d, \rho, [r])|. \end{aligned}$$

Suppose that $Z = 1$, and let $\hat{B} = B \in \text{Blk}(G)$ with a defect group $D = D(B)$ and the Brauer correspondent $b \in \text{Blk}(N_G(D))$. Then $k(N(D), B, d(B), [r])$ is the number of characters $\varphi \in \text{Irr}(b)$ such that φ has height 0 and $r(\varphi) \equiv \pm r \pmod{p}$, where $d(B)$ is the defect of B .

ISAACS–NAVARRO CONJECTURE (see [12, Conjecture B]). *In the notation above,*

$$k(G, B, d(B), [r]) = k(N(D), B, d(B), [r]).$$

The following refinement of Dade’s conjecture is due to Uno.

UNO’S PROJECTIVE CONJECTURE (see [15, Conjecture 3.2]). *If $O_p(G) = 1$ and if $D(\hat{B}) \neq O_p(Z)$, then for any integer $d \geq 0$, faithful $\rho \in \text{Irr}(Z)$ and $1 \leq r \leq (p-1)/2$,*

$$\sum_{C \in \mathcal{R}/G} (-1)^{|C|} k(N_{\hat{G}}(C), \hat{B}, d, \rho, [r]) = 0. \tag{2.4}$$

Similarly, if $Z = 1$, then the projective conjecture is the ordinary conjecture. Note also that if $p = 2$ or $p = 3$, then Uno’s conjecture is equivalent to Dade’s conjecture.

Let G be the Baby Monster, \mathbb{B} . Then its Schur multiplier is cyclic of order 2, and its outer automorphism group is trivial, so Dade’s projective conjecture is equivalent to his reductive conjecture (and Uno’s reductive conjecture is also equivalent to his reductive conjecture). Thus it suffices to verify:

1. Dade’s ordinary conjecture for \mathbb{B} ;
2. Dade’s projective conjecture for the 2 covering group $2 \cdot \mathbb{B}$ when $p = 3$;
3. Uno’s ordinary conjecture for \mathbb{B} ; and
4. Uno’s projective conjecture for $2 \cdot \mathbb{B}$ when $p \geq 5$.

The proofs of the following two lemmas are straightforward.

LEMMA 2.1. *Let $\sigma : O_p(G) < P_1 < \dots < P_{m-1} < Q = P_m < P_{m+1} < \dots < P_\ell$ be a fixed radical p -chain of a finite group G , where $1 \leq m < \ell$. Suppose that*

$$\sigma' : O_p(G) < P_1 < \dots < P_{m-1} < P_{m+1} < \dots < P_\ell$$

is also a radical p -chain such that $N_G(\sigma) = N_G(\sigma')$. Let $\mathcal{R}^-(\sigma, Q)$ be the subfamily of $\mathcal{R}(G)$ consisting of chains C whose $(\ell-1)$ th subchain, $C_{\ell-1}$, is conjugate to σ' in G . Let $\mathcal{R}^0(\sigma, Q)$ be the subfamily of $\mathcal{R}(G)$ consisting of chains C whose ℓ th subchain C_ℓ is conjugate to σ in G . Then the map g sending any $O_p(G) < P_1 < \dots < P_{m-1} < P_{m+1} < \dots < P_\ell < \dots$ in $\mathcal{R}^-(\sigma, Q)$ to $O_p(G) < P_1 < \dots < P_{m-1} < Q < P_{m+1} < \dots < P_\ell < \dots$ induces a bijection, denoted again by g , from $\mathcal{R}^-(\sigma, Q)$ onto $\mathcal{R}^0(\sigma, Q)$. Moreover, for any C in $\mathcal{R}^-(\sigma, Q)$, we have $|C| = |g(C)| - 1$ and $N_G(C) = N_G(g(C))$.

LEMMA 2.2. *Suppose that Q is a p -subgroup of G . Then Q is radical in G if and only if $N_G(Q) \leq M$ and Q is radical in M for some maximal p -local subgroup M of G .*

LEMMA 2.3. *If Q is a p -subgroup of a finite group G , then there is a radical p -subgroup R such that*

$$Q \leq R \quad \text{and} \quad N_G(Q) \leq N_G(R).$$

Proof. This follows by [2, Lemma 2.1]. □

3. Construction of permutation representations of maximal p -local subgroups

We will follow the notation of [7]. In particular, if p is odd, then $p^{1+2\gamma} = p_+^{1+2\gamma}$ is an extra-special group of order $p^{1+2\gamma}$ with exponent p , and if $\delta = +$ or $\delta = -$, then $2_\delta^{1+2\gamma}$ is an extra-special group of order $2^{1+2\gamma}$ with type δ . If X and Y are groups, we use $X.Y$, $X \cdot Y$ and $X : Y$ to denote an extension, a nonsplit extension and a split extension of X by Y , respectively. Given a positive integer n , we use p^n to denote the elementary abelian group of order p^n , n to denote the cyclic group of order n , D_{2n} to denote the dihedral group of order $2n$, and SD_{2n} to denote the semidihedral group of order $2n$.

The subgroups of $2 \cdot \mathbb{B}$ that we need to construct are given in Table 1.

The general strategy in most cases is to make appropriate subgroups of the Monster first, and to centralize a suitable involution to get the desired subgroup of $2 \cdot \mathbb{B}$. We can then quotient by the central involution to obtain the corresponding subgroup of \mathbb{B} .

Table 1: Maximal p -local subgroups of \mathbb{B} and $2 \cdot \mathbb{B}$.

Shape in \mathbb{B}	Shape in $2 \cdot \mathbb{B}$	Overgroup in \mathbb{M}
$(7:3 \times 2 \cdot L_3(4).2).2$	$(7:3 \times 2^2 \cdot L_3(4).2).2$	$(7:3 \times \text{He}):2$
$(2^2 \times 7^2:(3 \times 2A_4)).2$	$(D_8 \times 7^2:(3 \times 2A_4)).2$	$(L_2(7) \times 7^2:(3 \times 2A_4)).2$
$5:4 \times \text{HS}:2$	$(D_{10} \times 2 \cdot \text{HS}.2).2$	$(D_{10} \times \text{HN}).2$
$5^{1+4}.2_+^{1+4}.A_5.4$	$5^{1+4}.2.2_+^{1+4}.A_5.4$	$5^{1+6}.2 \cdot J_2.4$
$5^2:4S_4 \times S_5$	$(5^2:4A_4 \times 2 \cdot S_5).2$	$(5^2:4 \circ Q_8 \times U_3(5)):S_3$
$5^3 \cdot L_3(5)$	$2 \times 5^3 \cdot L_3(5)$	n/a
$S_3 \times \text{Fi}_{22}:2$	$(S_3 \times 2 \cdot \text{Fi}_{22}).2$	$3 \cdot \text{Fi}_{24}$
$3^{1+8}.2_+^{1+6}.U_4(2).2$	$3^{1+8}.2.2_+^{1+6}.U_4(2).2$	$3^{1+12}.2 \cdot \text{Suz}:2$
$(3^2:D_8 \times U_4(3).2^2).2$	$(3^2:2 \times 2 \cdot U_4(3).2^2).D_8$	$(3^2:2 \times O_8^+(3)) \cdot S_4$
$3^2.3^3.3^6.(S_4 \times 2 \cdot S_4)$	$3^2.3^3.3^6:(2 \cdot S_4 \times 2 \cdot S_4)$	$3^2.3^5.3^{10}(M_{11} \times 2 \cdot S_4)$
$3^3.3.3^3.3^3(L_3(3) \times 2)$	$2 \times 3^3.3.3^3.3^3(L_3(3) \times 2)$	$2 \times \text{Fi}_{23}$
$3^3.3^6(L_3(3) \times D_8)$	$3^3.3^6(L_3(3) \times SD_{16})$	$(2 \times O_8^+(3)) \cdot S_4$
$3^6:(2 \times L_4(3)).2^2$	$2 \times 3^6:(L_4(3).SD_{16})$	$(2 \times O_8^+(3)) \cdot S_4$

Many of the groups required are subdirect products, and are thus easy to construct from representations of the constituent groups. For example, to make $(7:3 \times \text{He}):2$ we first make the Frobenius group $7:6$ generated by the permutations $a = (1, 2, 3, 4, 5, 6, 7)$ and $b = (1, 3, 2, 6, 4, 5)$, and $\text{He}:2$ generated by two permutations c and d on 2058 points. Since a and c are in the respective subgroups of index 2, while b and d are not, we see that ac and bd together generate the desired group $(7:3 \times \text{He}):2$ acting on $7 + 2058 = 2065$ points. Inside this group, we then find the involution centralizer by standard methods, and obtain $(7:3 \times 2^2 \cdot L_3(4).2).2$ as the required subgroup of $2 \cdot \mathbb{B}$. Taking the quotient by the central involution, we obtain the corresponding subgroup $(7:3 \times 2 \cdot L_3(4).2).2$ of \mathbb{B} .

Similarly, we construct the affine group $7^2:(3 \times 2S_4) < 7^2:\text{GL}_2(7)$ as a permutation group on forty-nine points, and $L_2(7):2$ as a permutation group on eight points. Thus we obtain the direct product acting on fifty-seven points, and its subgroup $(7^2:(3 \times 2A_4) \times L_2(7)).2$ of index 2 in the same way as above. By centralizing an involution in the $L_2(7)$ subgroup we obtain the required subgroup $(7^2:(3 \times 2A_4) \times D_8).2$ of $2 \cdot \mathbb{B}$, and its quotient $(7^2:(3 \times 2A_4) \times 2^2).2$ in \mathbb{B} . This completes the construction of the maximal 7-local subgroups of \mathbb{B} and $2 \cdot \mathbb{B}$.

Next consider the 5-local subgroups. We can make $(D_{10} \times \text{HN}).2$ as a subdirect product on $5 + 1\,140\,000$ points, and we centralize an involution to get $(D_{10} \times 2 \cdot \text{HS}:2).2$ and its quotient $5:4 \times \text{HS}:2$. However, these permutations are rather large, so we actually made the group directly as a subdirect product of $5:4$ and $4 \cdot \text{HS}:2$. Note that there is an outer element of $(D_{10} \times 2 \cdot \text{HS}:2).2$, which acts as the outer automorphism of $2 \cdot \text{HS}:2$ (multiplying elements outside $2 \cdot \text{HS}$ by the central involution) and squares to the product of an involution in the D_{10} and the central involution of $2 \cdot \text{HS}$.

Similarly, we make $5^{1+6}:2 \cdot J_2.4$ by following the instructions in [14] for making groups of extraspecial type. Specifically, we make a matrix representation in eight dimensions over $\text{GF}(5)$ in which a complementary $2J_2.4$ and the normal 5^{1+6} are represented by matrices of shape

$$\begin{pmatrix} \mu & 0 & 0 \\ 0 & A & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad \text{and} \quad \begin{pmatrix} 1 & 0 & 0 \\ -Sv^T & I_6 & 0 \\ \lambda & v & 1 \end{pmatrix},$$

respectively, where A is a typical element of $2 \cdot J_2.4$ in its six-dimensional representation over \mathbb{F}_5 , and S is the matrix of the symplectic form preserved by $2J_2$ in this representation (note that S has inadvertently been replaced by S^{-1} from the bottom of [14, p. 316]), and μ is the scalar such that $ASA^T = \mu S$. We can then convert to a permutation representation on the $5^7 = 78\,125$ images of the vector $(0, 0, 0, 0, 0, 0, 0, 1)$. Centralizing a suitable involution leads to the corresponding subgroups $5^{1+4}:2 \cdot 2_{-}^{1+4}.A_5.4$ of $2 \cdot \mathbb{B}$ and $5^{1+4}:2_{-}^{1+4}.A_5.4$ of \mathbb{B} .

The next subgroup can be made as a subdirect product of the affine group $5^2:4S_4 < 5^2:\text{GL}_2(5)$ (on twenty-five points) and the almost simple group $U_3(5):S_3$ (on 126 points) leading to $(5^2:4 \circ Q_8 \times U_3(5)):S_3$ on 151 points. We then centralize an involution to get $(5^2:4A_4 \times 2S_5).2$ in $2 \cdot \mathbb{B}$ and $5^2:4S_4 \times S_5$ in \mathbb{B} .

Finally for $p = 5$, we find that $5^3 \cdot L_3(5)$ is isomorphic to a subgroup of the Lyons group, for which generators are available [17] as 111×111 matrices over $\text{GF}(5)$. This can be converted to a permutation representation on 7750 points, by permuting a suitable orbit of vectors in a suitable subquotient of this representation. As there is no double cover of $L_3(5)$, the corresponding subgroup of $2 \cdot \mathbb{B}$ is a direct product $2 \times 5^3 \cdot L_3(5)$. This concludes the construction of the maximal 5-local subgroups.

We next take $3 \cdot \text{Fi}_{24}$ acting on $3 \times 306\,936$ points from [17], and centralize an involution to get $(S_3 \times 2\text{Fi}_{22}).2$. Its quotient $S_3 \times \text{Fi}_{22}:2$ is a direct product; it is thus easily constructed as a permutation group on $3 + 3510$ points.

For the next group, we could take $3^{1+12}:2 \cdot \text{Suz}:2$ as constructed in [14], and convert it into permutations on $3^{13} = 1594323$ points. Although this is not a subgroup of the Monster, the involution centralizer $3^{1+8}:2 \cdot 2_{-}^{1+6}U_4(2).2$ is isomorphic to the desired subgroup of $2 \cdot \mathbb{B}$. However, these permutations are rather large, so instead we take the involution centralizer $2 \cdot 2_{-}^{1+6}U_4(2).2$ in $2 \cdot \text{Suz}.2$, acting on an 8-space and a 4-space over $\text{GF}(3)$. We lift the action on the 8-space to an action of $3^{1+8}:2_{-}^{1+6}U_4(2).2$ on a 10-space, and thence to an action on $3^9 = 19\,683$ points. To get the double cover, we adjoin the permutation action on the eighty non-zero vectors of the 4-space.

We take $(3^2:2 \times O_8^+(3)).S_4$ as a subdirect product of the affine group $3^2:2S_4$ on nine points and $O_8^+(3):S_4$ on 3360 points, and then find the involution centralizer $(3^2:2 \times 2 \cdot U_4(3).2^2).D_8$ and its quotient $(3^2:D_8 \times U_4(3).2^2).2$. Another involution centralizer $(2 \times O_8^+(3)) \cdot S_4$ contains the last two 3-locals in Table 1, corresponding to certain maximal parabolic subgroups in $O_8^+(3):S_4$. These are therefore straightforward to construct. The third last of the maximal 3-local subgroups listed in Table 1 is contained in Fi_{23} , which becomes $2 \times \text{Fi}_{23}$ in $2 \cdot \mathbb{B}$. It can therefore be constructed by using information on the character tables of maximal subgroups of Fi_{23} , given in [10].

Finally, we need to construct $3^2 \cdot 3^3 \cdot 3^6(S_4 \times 2S_4)$ and its double cover. The latter is a subgroup of the group $3^2 \cdot 3^5 \cdot 3^{10}:(M_{11} \times 2 \cdot S_4)$ in the Monster, and so has shape $3^2 \cdot 3^3 \cdot 3^6:(2 \cdot S_4 \times 2 \cdot S_4)$. We first make the corresponding subgroup of \mathbb{B} by explicitly finding words in the standard generators which generate this subgroup. To do this, we start from $3^{1+8}:2_{-}^{1+6}U_4(2).2$, and find a subgroup $3^2 \cdot [3^7].2 \cdot 3^3(S_4 \times 2)$, being the normalizer of a $3B$ -pure 3^2 generated by the centre and one other element of 3^{1+8} . We then go to work in the centralizer of an S_4 to find an element swapping the two generators for the 3^2 . First we centralize a suitable involution in the S_4 , to get a group $(2^2 \times F_4(2)):2$, and then we centralize an element of order 4 squaring to this involution, to get a group $4 \times {}^2F_4(2)$. In here, we find by random search, an involution that extends our 3^2 to A_6 , in which it is easy to find the involution that we are seeking. This involution now extends the group $3^2 \cdot [3^9] \cdot (S_4 \times 2 \times S_3)$ to the maximal subgroup $3^2 \cdot 3^3 \cdot 3^6 \cdot (S_4 \times 2 \cdot S_4)$ of \mathbb{B} , which we are seeking.

To construct a suitable permutation representation, we find a subgroup of order $2^5 \cdot 3^5$ centralizing an involution, and permute the $2^2 \cdot 3^8 = 26244$ images of a fixed vector of this subgroup. To construct the double cover, observe that we need only to cover the quotient S_4 , which we can do by taking a subdirect product with the group $2 \cdot S_4 \cong \text{GL}_2(3)$ acting on eight points.

4. A local subgroup strategy and fusions

From [16], we know that each radical p -subgroup R of \mathbb{B} is radical in one of the conjugates M of maximal p -local subgroups constructed in Section 3 and, further, $N_{\mathbb{B}}(R) = N_M(R)$.

In [4] and [5], a (modified) local strategy was developed to classify the radical p -subgroups R . We review this method here. Suppose that M is a subgroup of a finite group G satisfying $N_G(R) = N_M(R)$.

Step (1) We first consider the case where M is p -local. Let $Q = O_p(M)$, so that $Q \leq R$. Choose a subgroup X of M . We explicitly compute the coset action of M on the cosets of X

in M ; we obtain a group W representing this action, a group homomorphism f from M to W , and the kernel K of f . For a suitable X , we have $K = Q$, and the degree of the action of W on the cosets is much smaller than that of M . We can now directly classify the radical p -subgroup classes of W (or apply Step (2) below to W), and the preimages in M of the radical subgroup classes of W are the radical subgroup classes of M .

Step (2) Now consider the case where M is not p -local. We may be able to find its radical p -subgroup classes directly. Alternatively, we find a (maximal) subgroup K of M such that $N_K(R) = N_M(R)$ for each radical subgroup R of M . If K is p -local, then we apply Step (1) to K . If K is not p -local, we can replace M by K , and repeat Step (2).

Steps (1) and (2) constitute the modified local strategy. After applying the strategy, we list the radical subgroups of each M , and then do the fusions as follows.

Suppose that R is a radical p -subgroup of M . Using the local structure, we can determine whether or not $N_M(R)$ is a subgroup of another maximal subgroup M' . Suppose that $N_M(R)$ is a subgroup of M' . By Lemma 2.3, there is a radical subgroup R' of M' such that $R \leq R'$ and $N_M(R) \leq N_{M'}(R')$. Using the local structure, we can determine whether or not R is radical in M' , and if so, we can identify R with a radical subgroup R' of M' . Some details are given in the proof of Proposition 5.1.

The computations reported in this paper were carried out using MAGMA V2.10-6 on a Sun UltraSPARC Enterprise 4000 server.

5. Radical subgroups and weights

Let $\mathcal{R}_0(G, p)$ be a set of representatives for conjugacy classes of radical p -subgroups of G . For $H, K \leq G$, we write $H \leq_G K$ if $x^{-1}Hx \leq K$, and we write $H \in_G \mathcal{R}_0(G, p)$ if $x^{-1}Hx \in \mathcal{R}_0(G, p)$ for some $x \in G$.

Let G be the Baby Monster \mathbb{B} . Then

$$|G| = 2^{41} \cdot 3^{13} \cdot 5^6 \cdot 7^2 \cdot 11 \cdot 13 \cdot 17 \cdot 19 \cdot 23 \cdot 31 \cdot 47,$$

and we may suppose that $p \in \{2, 3, 5, 7\}$, since both conjectures hold for a block with a cyclic defect group, by [8, Theorem 7.1] and [3, Theorem 5.2]. Suppose that p is odd, so that $p = 3, 5, 7$.

Denote by $\text{Irr}^0(H)$ the set of ordinary irreducible characters of p -defect 0 of a finite group H , and by $d(H)$ the number $\log_p(|H|_p)$. Given $R \in \mathcal{R}_0(G, p)$, let $C(R) = C_G(R)$, $N = N_G(R)$ and $\hat{N} = N_{2, \mathbb{B}}(R)$, where R is viewed as a subgroup of the covering group $2.\mathbb{B}$. If $B_0 = B_0(G)$ is the principal p -block of G , then (see [4, (4.1)])

$$\mathcal{W}(B_0) = \sum_R |\text{Irr}^0(N/C(R)R)|, \tag{5.1}$$

where R runs over the set $\mathcal{R}_0(G, p)$ such that $d(C(R)R/R) = 0$. The character table of $N/C(R)R$ can be calculated by MAGMA, and so we find $|\text{Irr}^0(N/C(R)R)|$. Write $\mathcal{W}_N = |\text{Irr}^0(N/C(R)R)|$ and $\mathcal{W}_{\hat{N}} = |\text{Irr}^0(N_{2, \mathbb{B}}(R)/C(R)R)| - |\text{Irr}^0(N/C(R)R)|$; the latter will be used to calculate the number of weights for $2.\mathbb{B}$.

PROPOSITION 5.1. *The non-trivial radical p -subgroups R of $G = \mathbb{B}$ (up to conjugacy) and their local structures are given in Tables 2 and 3, according to whether $p \geq 5$ or $p = 3$, where $S \in \text{Syl}_3(G)$ is a Sylow 3-subgroup of G .*

Proof. Case (1) Suppose that $p = 7$. By [16, Section 7], \mathbb{B} has two non-trivial radical 7-subgroups, 7 and 7^2 , with local structures given by Table 2.

Case (2) Suppose that $p = 5$. By [16, Theorem 6.4], \mathbb{B} has four maximal 5-local subgroups:

$$\begin{aligned} M_1 &= N(5A) = 5:4 \times \text{HS}:2; & M_2 &= N(5B^3) = 5^3 \cdot L_3(5); \\ M_3 &= N(5B) = 5_+^{1+4} \cdot 2_-^{1+4} \cdot A_{5,4}; & M_4 &= N(5A^2) = 5^2 \cdot 4S_4 \times S_5. \end{aligned}$$

Let $M = M_3$ or $M = M_4$. Since $|M/O_5(M)|_5 = 5$, it follows that a Sylow subgroup of M is its only radical 5-subgroup other than $O_5(M)$. Thus

$$\mathcal{R}_0(M_i, 5) = \begin{cases} \{5^2, 5^3\} & \text{if } i = 4, \\ \{5_+^{1+4}, 5_+^{1+4} \cdot 5\} & \text{if } i = 3; \end{cases} \quad (5.2)$$

in addition, $N_{M_4}(5^3) = 5^2 \cdot 4S_4 \times 5:4$, and $N_{M_3}(5_+^{1+4} \cdot 5) = 5_+^{1+4} \cdot 5 \cdot 4^2$.

We may take

$$\mathcal{R}_0(M_1, 5) = \{5, 5^2, 5 \times 5_+^{1+2}\},$$

where $5 \times 5_+^{1+2} \in \text{Syl}_5(M_1)$. In addition,

$$N_{M_1}(R) = \begin{cases} 5:4 \times 5:4 \times S_5 & \text{if } R = 5^2, \\ 5 \times 5_+^{1+2} \cdot 4 \cdot D_8 & \text{if } R = 5 \times 5_+^{1+2}. \end{cases}$$

Note that $5^2 \in_{\mathbb{B}} \mathcal{R}_0(M_4, 5)$, so $N_{\mathbb{B}}(R) \neq N_{M_1}(R)$ for any $R \in \mathcal{R}_0(M_1, 5) \setminus \{5\}$.

We may take

$$\mathcal{R}_0(M_2, 5) = \{5^3, 5_+^{1+4}, 5^2 \cdot 5_+^{1+2}, 5_+^{1+4} \cdot 5\};$$

in addition,

$$\begin{aligned} C_{M_2}(5_+^{1+4}) &= 5 = Z(5_+^{1+4}); \\ N_{M_2}(5^2 \cdot 5_+^{1+2}) &= 5^2 \cdot 5_+^{1+2} \cdot \text{GL}_2(5); & N_{M_2}(5_+^{1+4}) &= 5_+^{1+4} \cdot \text{GL}_2(5). \end{aligned}$$

Table 2: Non-trivial radical p -subgroups of \mathbb{B} with $p \geq 5$.

R	$C(R)$	N	\mathcal{W}_N	$\mathcal{W}_{\hat{N}}$
7	$7 \times 2 \cdot L_3(4):2$	$(7:3 \times 2 \cdot L_3(4):2):2$		
7^2	$2^2 \times 7^2$	$(2^2 \times 7^2:(3 \times 2A_4)):2$	24	24
5	$5 \times \text{HS}:2$	$5:4 \times \text{HS}:2$		
5^2	$5^2 \times S_5$	$5^2:4S_4 \times S_5$		
5^3	5^3	$5^3 \cdot L_3(5)$	1	1
5_+^{1+4}	5	$5_+^{1+4} \cdot 2_-^{1+4} \cdot A_{5,4}$	30	12
$5^2 \cdot 5_+^{1+2}$	5^2	$5^2 \cdot 5_+^{1+2} \cdot \text{GL}_2(5)$	4	4
$5_+^{1+4} \cdot 5$	5	$5_+^{1+4} \cdot 5 \cdot 4^2$	16	16

Since \mathbb{B} has exactly two classes, $5A$ and $5B$, of elements of order 5 and $|N(5A)|_5 = 5^4$, it follows that a generator of $C_{M_2}(5_+^{1+4})$ is in a $5B$ -class, and so we may suppose that $N_{M_2}(5_+^{1+4}) \leq M_3 = N(5B)$. In particular, $N_{M_2}(5_+^{1+4}) \neq N_{\mathbb{B}}(5_+^{1+4})$.

Since $|N_{M_2}(5^2.5^{1+2})|_5 = 5^6$, it follows that M_1 and M_4 have no subgroup conjugate to $N_{M_2}(5^2.5^{1+2})$. Applying Lemma 2.3, we see that $N_{M_2}(5^2.5^{1+2}) \not\leq_{\mathbb{B}} M_3$, so by Lemma 2.2, $5^2.5^{1+2}$ is radical in \mathbb{B} with $N_{\mathbb{B}}(5^2.5^{1+2}) = N_{M_2}(5^2.5^{1+2})$. This classifies the radical 5-subgroups of \mathbb{B} .

Case (3) Suppose that $p = 3$. By [16, Theorem 5.7], \mathbb{B} has seven maximal 3-local subgroups:

$$\begin{aligned} M_1 &= N(3B) = 3_+^{1+8}.2_-^{1+6}.U_4(2):2; & M_2 &= N(3B^2) = 3^2.3^3.3^6.(S_4 \times 2S_4); \\ M_3 &= N(3B^3) = 3^3.3^6.(L_3(3) \times D_8); & M_4 &= N(3B^3) = 3^3.3.3^3.3^3.(L_3(3) \times 2); \\ M_5 &= N(3A) = S_3 \times \text{Fi}_{22}:2; & M_6 &= N(3A^2) = (3^2:D_8 \times U_4(3):2^2).2; \\ M_7 &= N(3^6) = 3^6:(2 \times L_4(3)):2. \end{aligned}$$

We first classify the radical subgroups of each M_i , applying the modified local strategy, and do the fusions in \mathbb{B} using Lemmas 2.3 and 2.2.

Case (3.1) We may take

$$\mathcal{R}_0(M_1, 3) = \{3^{1+8}, 3^{1+8}.3, 3^{1+8}.3^2, 3^{1+8}.3^3, 3^{1+8}.3^{1+2}, S\}. \tag{5.3}$$

Since $C_{M_1}(R) = 3 = Z(R)$ for each $R \in \mathcal{R}_0(M_1, 3)$, it follows that $N_{\mathbb{B}}(R) \leq_{\mathbb{B}} M_1$, so R is radical in \mathbb{B} with $N_{M_1}(R) = N_{\mathbb{B}}(R)$. Thus we may suppose that $\mathcal{R}_0(M_1, 3) \subseteq \mathcal{R}_0(\mathbb{B}, 3)$.

Table 3: Non-trivial radical 3-subgroups of \mathbb{B} .

R	$C(R)$	$N(R)$	\mathcal{W}_N	$\mathcal{W}_{\hat{N}}$
3	$3 \times \text{Fi}_{22}:2$	$S_3 \times \text{Fi}_{22}:2$		
3^2	$3^2 \times U_4(3):2^2$	$(3^2:D_8 \times U_4(3):2^2).2$		
3^6	3^6	$3^6:(2 \times L_4(3)):2$	5	2
3_+^{1+8}	3	$3_+^{1+8}.2_-^{1+6}.U_4(3).2$	11	1
$3^3.3^6$	3^3	$3^3.3^6.(L_3(3) \times D_8)$	5	2
$3_+^{1+8}.3$	3	$3_+^{1+8}.3.2^2.2^4.3^2.D_8$	10	4
$3^3.3.3^3.3^3$	3^3	$3^3.3.3^3.3^3.(L_3(3) \times 2)$	2	2
$3_+^{1+8}.3^2$	3	$3_+^{1+8}.3^2.(D_8 \times 2S_4)$	10	4
$3^2.3^3.3^6$	3^2	$3^2.3^3.3^6.(S_4 \times 2S_4)$	4	0
$3_+^{1+8}.3^3$	3	$3_+^{1+8}.3^3.2^4.S_3$	8	0
$3_+^{1+8}.3_+^{1+2}$	3	$3_+^{1+8}.3_+^{1+2}.(2 \times 2S_4)$	4	4
$3^2.3^3.3^6.3$	3^2	$3^2.3^3.3^6.3.(2 \times 2S_4)$	4	4
S	3	$S.2^3$	8	8

Case (3.2) Applying the local strategy, we find four classes of radical subgroups of M_2 ; one of them, R , has order 3^{12} satisfying $C_{M_2}(R) = Z(R) = 3$ and $N_{M_2}(R) = R.2.(S_4 \times 2)$. Thus a generator of $Z(R)$ is a $3B$ -element as $|N(3A)|_3 = 3^{10}$, and we may suppose that $N_{M_2}(R) \leq M_1$. By Lemma 2.3 and (5.3), R is radical in M_1 , and by the local structures, $R =_{M_1} 3^{1+8}.3^3$.

Another radical subgroup Q of M_2 also has order 3^{12} and $C_{M_2}(Q) = 3^2 = Z(Q)$. So $N_{\mathbb{B}}(Q) \leq_{\mathbb{B}} M_2$ and Q is radical in \mathbb{B} . We may take

$$\mathcal{R}_0(M_2, 3) = \{3^2.3^3.3^6, 3^{1+8}.3^3, 3^2.3^3.3^6.3, S\}, \quad (5.4)$$

and $N_{\mathbb{B}}(R) = N_{M_2}(R)$ for each $R \in \mathcal{R}_0(M_2, 3)$, so we may suppose that $\mathcal{R}_0(M_2, 3) \subseteq \mathcal{R}_0(\mathbb{B}, 3)$.

Case (3.3) M_3 has 4 classes of radical subgroups; one of them, R , has order 3^{11} with $C_{M_3}(R) = Z(R) = 3^2$ and $N_{M_3}(R) = R.(2S_4 \times D_8)$. Thus $Z(R)$ is $3B$ -pure, and by [16, Theorem 4.4] we may suppose that $N_{M_3}(R) \leq M_2$. By (5.4) and Lemma 2.2, R is non-radical in \mathbb{B} .

Another radical subgroup Q of M_3 also has order 3^{11} and $C_{M_3}(Q) = Z(Q) = 3$, so that $Z(Q)$ is generated by a $3B$ -element and we may suppose that $N_{M_3}(Q) \leq M_1$. By the local structures, we can identify Q with $3^{1+8}.3^2$. We may take

$$\mathcal{R}_0(M_3, 3) = \{3^3.3^6, 3^3.3^6.3^2, 3^{1+8}.3^2, 3^{1+8}.3^2.3\}, \quad (5.5)$$

and $N_{\mathbb{B}}(R) \neq N_{M_3}(R)$ for $R \in \mathcal{R}_0(M_2, 3) \setminus \{3^3.3^6, 3^{1+8}.3^2\}$. Moreover, $C_{M_3}(3^3.3^6.3^2) = 3^2$, $C_{M_3}(3^{1+8}.3^2.3) = 3$, and

$$N_{M_3}(R) = \begin{cases} 3^3.3^6.3^2.(2S_4 \times D_8) & \text{if } R = 3^3.3^6.3^2, \\ 3^{1+8}.3^2.3.(2^2 \times D_8) & \text{if } R = 3^{1+8}.3^2.3. \end{cases}$$

Case (3.4) The fusions in \mathbb{B} of the radical subgroups of M_4 with subgroups in other $\mathcal{R}_0(M_i, 3)$ can be done similarly to that of Case (3.2). We may take

$$\mathcal{R}_0(M_4, 3) = \{3^3.3.3^3.3^3, 3^2.3^3.3^6.3, 3^{1+8}.3^{1+2}, S\}, \quad (5.6)$$

and $N_{\mathbb{B}}(R) = N_{M_4}(R)$ for each $R \in \mathcal{R}_0(M_4, 3)$, so we may suppose that $\mathcal{R}_0(M_4, 3) \subseteq \mathcal{R}_0(\mathbb{B}, 3)$.

Case (3.5) M_7 has six classes of radical subgroups R , three of which have centralizer $C_{M_7}(R) = Z(R) = 3$, and $|N_{M_7}(R)|_3 \geq 3^{11}$. So a generator of $Z(R)$ is a $3B$ -element, and we may suppose that $N_{M_7}(R) \leq M_1$. By (5.3) and the local structures, we find that one of the subgroups R is conjugate to $3^{1+8}.3$, and the other two are not radical in \mathbb{B} .

A radical subgroup Q of M_7 has order 3^9 and $C_{M_7}(Q) = Z(Q) = 3^3$. Since we have $|C_{M_7}(x)|_3 \geq 3^{11}$ for each $x \in Z(Q)$, $Z(Q)$ is $3B$ -pure, and by [16, Theorem 4.4], $N_{M_7}(Q) = Q.(2^2 \times L_3(3)) \leq_{\mathbb{B}} M_i$ for some $i = 1, 2, 3, 4$. By Lemma 2.2 and equations (5.3)–(5.6), Q is not a radical subgroup of \mathbb{B} .

Similarly, M_7 has a radical subgroup W of order 3^{11} with $Z(W) = 3^2$, so that $Z(W)$ is $3B$ -pure and $N_{M_7}(W) = W.(2 \times 2S_4:2):2 \leq_{\mathbb{B}} M_i$ for some $i = 1, 2, 3, 4$. This implies that W is not radical in \mathbb{B} . Thus we may take

$$\mathcal{R}_0(M_7, 3) = \{3^6, 3^{3+6}, 3^{1+8}.3, 3^6.3^{2+3}, 3^2.3^3.3^6, 3^{3+6}.3^{1+2}\}, \quad (5.7)$$

and $N_{M_7}(R) \neq N_{\mathbb{B}}(R)$ for $R \in \mathcal{R}_0(M_7, 3) \setminus \{3^6, 3^{1+8}.3\}$.

Moreover,

$$\begin{aligned} C_{M_7}(3^{3+6}) &= 3^3, \\ C_{M_7}(3_+^{1+8}.3) &\cong C_{M_7}(3^6.3^{2+3}) \cong C_{M_7}(3^{3+6}.3^{1+2}) = 3, \\ C_{M_7}(3^2.3^3.3^6) &= 3^2, \end{aligned}$$

and

$$N_{M_7}(R) = \begin{cases} 3^{3+6}.(2^2 \times L_3(3)) & \text{if } R = 3^{3+6}, \\ 3^6.3^{2+3}.(2^2 \times 2S_4) & \text{if } R = 3^6.3^{2+3}, \\ 3^2.3^3.3^6.(2 \times 2S_4:2).2 & \text{if } R = 3^2.3^3.3^6, \\ 3^{3+6}.3^{1+2}.2^3.2^2 & \text{if } R = 3^{3+6}.3^{1+2}. \end{cases} \quad (5.8)$$

Case (3.6) Since $M_5 = S_3 \times \text{Fi}_{22}:2$, it follows that each radical subgroup R is of the form $3 \times R_1$ for some $R_1 \in \mathcal{R}_0(\text{Fi}_{22}:2, 3)$. The fusion in \mathbb{B} of elements of order 3 in Fi_{22} is given by [16, Proposition 3.1]. The radical subgroups of M_5 and their local structures are given in Table 4.

Note that $R = 3^2$ is 3A-pure, so that $N_{\mathbb{B}}(3^2) \neq N_{M_5}(3^2)$. By [16, Proposition 3.2], \mathbb{B} has a unique class of elementary abelian groups of order 3^6 containing 3A-elements, and so $M_7 =_{\mathbb{B}} N_{\mathbb{B}}(3^6) \neq N_{M_5}(3^6)$.

Since the commutator subgroup $[3 \times 3_+^{1+6}, 3 \times 3_+^{1+6}] = (3 \times 3_+^{1+6})' = 3$ is 3B-pure, $N_{\mathbb{B}}(3 \times 3_+^{1+6}) \leq_{\mathbb{B}} N(3B) = M_1$. But $N_{M_5}(R) \leq_{M_5} N_{M_5}(3 \times 3_+^{1+6})$ for $R = 3 \times 3_+^{1+6}.3$ and $R = 3 \times 3^5.3^3$; also, $C_{M_5}(R) \cong 3^2 = C_{M_5}(3 \times 3_+^{1+6})$, so $N_{\mathbb{B}}(R) \leq_{\mathbb{B}} M_1$, and by Lemma 2.2 and (5.3), none of them is radical in \mathbb{B} .

Suppose that $R = 3 \times 3^5.3_+^{1+2}$. Then $[R, R'] = Z(3^5:3_+^{1+2}) = 3^2$ is 3B-pure, $N_{\mathbb{B}}(R) \leq_{\mathbb{B}} N(3B^2) = M_2$ and, by (5.4), R is non-radical in \mathbb{B} .

Since $(3 \times 3^{3+3})' = 3^3$ is 3B-pure, $N_{\mathbb{B}}(R) \leq_{\mathbb{B}} M_4$ and, by (5.6), R is non-radical in \mathbb{B} . It follows that $N_{M_5}(R) \neq N_{\mathbb{B}}(R)$ for any $R \in \mathcal{R}_0(M_5, 3) \setminus \{3\}$.

Table 4: Radical 3-subgroups of $S_3 \times \text{Fi}_{22}:2$.

R	$C(R)$	$N_{M_5}(R)$
3	$3 \times \text{Fi}_{22}:2$	$S_3 \times \text{Fi}_{22}:2$
3^2	$3^2 \times U_4(3):2^2$	$S_3 \times (S_3 \times U_4(3):2).2$
3^6	3^6	$S_3 \times 3^5:(2 \times U_4(2):2)$
$3 \times 3^{3+3}$	3^4	$S_3 \times 3^{3+3}:L_3(3)$
$3 \times 3_+^{1+6}$	3^2	$S_3 \times 3_+^{1+6}.2^3.4.3^2.2^2$
$3 \times 3_+^{1+6}.3$	3^2	$S_3 \times 3_+^{1+6}.3:2S_4$
$3 \times 3^5.3^3$	3^2	$S_3 \times 3^5.3^3.(2 \times S_4).2$
$3 \times 3^5.3_+^{1+2}$	3^3	$S_3 \times 3^5.3_+^{1+2}.2S_4.2$
$3 \times 3_+^{1+6}.3^2$	3^2	$S_3 \times 3_+^{1+6}.3^2.2^3$

Case (3.7) We may take

$$\mathcal{R}_0(M_6, 3) = \{3^2, 3^6, 3^2 \times 3^{1+4}, 3^3 \cdot 3^2 \cdot 3^3\}; \quad (5.9)$$

in addition, $C_{M_6}(3^2 \times 3^{1+4}) = 3^3 = C_{M_6}(3^3 \cdot 3^2 \cdot 3^3)$ and

$$N_{M_6}(R) = \begin{cases} (3^2:D_8 \times 3^4:A_6:2^2).2 & \text{if } R = 3^6, \\ (3^2:D_8 \times 3^{1+4}.2S_4 : 2^2).2 & \text{if } R = 3^2 \times 3^{1+4}, \\ 3^3 \cdot 3^2 \cdot 3^3 \cdot 2^3 \cdot 2^2 \cdot 2^3 & \text{if } R = 3^3 \cdot 3^2 \cdot 3^3. \end{cases} \quad (5.10)$$

Thus $N_{M_6}(3^6) \neq_{\mathbb{B}} M_7$.

Since $C_{M_6}(3^2) =_{\mathbb{B}} C_{M_5}(3^2)$, we may suppose that $R = 3^2 \times 3^{1+4} \leq M_5$. Now $R' = 3$ is $3B$ -pure, and so $N_{\mathbb{B}}(R) \leq_{\mathbb{B}} N(3B)$ and R is not radical in \mathbb{B} .

It follows that $N_{M_6}(R) \neq N_{\mathbb{B}}(R)$ for each $R \in \mathcal{R}_0(M_6, 3) \setminus \{3^2\}$.

Thus the radical 3-subgroups of \mathbb{B} are listed in Table 3, and the centralizers and normalizers are given by MAGMA. □

LEMMA 5.2. *Let $G = \mathbb{B}$ and $B_0 = B_0(G)$, let $\text{Blk}^+(G, p)$ be the set of p -blocks with a non-trivial defect group, and let $\text{Irr}^+(G)$ be the characters of $\text{Irr}(G)$ with positive p -defect. If a defect group $D(B)$ of B is cyclic, then $\text{Irr}(B)$ is given by [11, p. 387].*

(a) *If $p = 7$, then $\text{Blk}^+(G, p) = \{B_i \mid 0 \leq i \leq 8\}$ such that $D(B_i) \cong 7^2$ when $0 \leq i \leq 2$ while $D(B_j) \cong 7$ when $3 \leq j \leq 8$. In the notation of [7, p. 208],*

$$\begin{aligned} \text{Irr}(B_1) &= \{\chi_2, \chi_4, \chi_{10}, \chi_{17}, \chi_{20}, \chi_{21}, \chi_{22}, \chi_{27}, \chi_{42}, \chi_{45}, \chi_{46}, \chi_{55}, \chi_{63}, \chi_{73}, \\ &\quad \chi_{77}, \chi_{85}, \chi_{88}, \chi_{100}, \chi_{103}, \chi_{106}, \chi_{118}, \chi_{121}, \chi_{134}, \chi_{161}, \chi_{166}, \chi_{167}, \chi_{176}\}, \\ \text{Irr}(B_2) &= \{\chi_7, \chi_9, \chi_{11}, \chi_{12}, \chi_{31}, \chi_{32}, \chi_{33}, \chi_{38}, \chi_{43}, \chi_{64}, \chi_{67}, \chi_{69}, \chi_{74}, \chi_{76}, \\ &\quad \chi_{90}, \chi_{91}, \chi_{92}, \chi_{94}, \chi_{96}, \chi_{105}, \chi_{107}, \chi_{112}, \chi_{115}, \chi_{117}, \chi_{119}, \chi_{126}, \chi_{135}\}, \end{aligned}$$

and

$$\text{Irr}(B_0) = \text{Irr}^+(G) \setminus \left(\bigcup_{i=1}^8 \text{Irr}(B_i) \right).$$

Moreover, $\ell(B_0) = \ell(B_1) = 24$, $\ell(B_2) = 21$, $\ell(B_i) = 6$ for $3 \leq i \leq 7$ and $\ell(B_8) = 3$.

(b) *If $p = 5$, then $\text{Blk}^+(G, p) = \{B_i \mid 0 \leq i \leq 6\}$ such that $D(B_i) \cong 5^2$ for $i = 1, 2$, and $D(B_j) \cong 5$ for $3 \leq j \leq 6$. In the notation of [7, p. 208],*

$$\begin{aligned} \text{Irr}(B_1) &= \{\chi_5, \chi_9, \chi_{14}, \chi_{18}, \chi_{32}, \chi_{40}, \chi_{54}, \chi_{56}, \chi_{81}, \chi_{93}, \\ &\quad \chi_{97}, \chi_{105}, \chi_{115}, \chi_{130}, \chi_{135}, \chi_{144}, \chi_{151}, \chi_{153}, \chi_{159}, \chi_{177}\}, \\ \text{Irr}(B_2) &= \{\chi_{27}, \chi_{29}, \chi_{34}, \chi_{44}, \chi_{55}, \chi_{64}, \chi_{67}, \chi_{74}, \chi_{80}, \chi_{82}, \\ &\quad \chi_{85}, \chi_{91}, \chi_{92}, \chi_{101}, \chi_{109}, \chi_{134}, \chi_{136}, \chi_{156}, \chi_{162}, \chi_{176}\}, \end{aligned}$$

and

$$\text{Irr}(B_0) = \text{Irr}^+(G) \setminus \left(\bigcup_{i=1}^6 \text{Irr}(B_i) \right).$$

Moreover, $\ell(B_0) = 51$, $\ell(B_1) = \ell(B_2) = 16$, and $\ell(B_j) = 4$ for $3 \leq j \leq 6$.

(c) If $p = 3$, then $\text{Blk}^+(G, p) = \{B_i \mid 0 \leq i \leq 5\}$ such that $D(B_i) \cong 3^2$ for $i = 1, 2, 3$, and $D(B_j) \cong 3$ for $4 \leq j \leq 5$. In the notation of [7, p. 208],

$$\text{Irr}(B_i) = \begin{cases} \{\chi_{30}, \chi_{33}, \chi_{79}, \chi_{97}, \chi_{107}, \chi_{123}, \chi_{126}, \chi_{151}, \chi_{164}\} & \text{if } i = 1, \\ \{\chi_{43}, \chi_{64}, \chi_{96}, \chi_{109}, \chi_{111}, \chi_{150}, \chi_{171}, \chi_{173}, \chi_{181}\} & \text{if } i = 2, \\ \{\chi_{63}, \chi_{76}, \chi_{91}, \chi_{100}, \chi_{105}, \chi_{106}, \chi_{154}, \chi_{156}, \chi_{162}\} & \text{if } i = 3. \end{cases}$$

Moreover, $\ell(B_0) = 71$, $\ell(B_1) = \ell(B_2) = 7$, $\ell(B_3) = 5$ and $\ell(B_j) = 2$ for $j = 4, 5$.

In addition, let $\hat{G} = 2.\mathbb{B}$ and let ξ be the faithful linear character of $\text{Irr}(Z(\hat{G}))$. If $p \in \{3, 5, 7\}$, then there is a unique p -block \hat{B} of \hat{G} such that \hat{B} covers the block $B(\xi)$ and the defect group $D(\hat{B})$ is non-cyclic. In the notation of [7, p. 218], let

$$\Omega = \begin{cases} \{\chi_j : j \in \{189, 192, 193, 197, 202, 205, 206, 207, 208, 222, 225, 234\}\} & \text{if } p = 7, \\ \{\chi_j : j \in \{204, 205, 206, 209\}\} & \text{if } p = 5, \\ \emptyset & \text{if } p = 3. \end{cases}$$

Then

$$\text{Irr}(\hat{B}) = \text{Irr}^+(\hat{G}) \setminus (\Omega \cup \text{Irr}^+(G))$$

and $\ell(\hat{B})$ is 24, 33 or 31 when p is 7, 5 or 3.

Proof. If $B \in \text{Blk}(G, p)$ is non-principal with $D = D(B)$, then $\text{Irr}^0(C(D)D/D)$ has a non-trivial character θ and $N(\theta)/C(D)D$ is a p' -group, where $N(\theta)$ is the stabilizer of θ in $N(D)$. By [11, p. 387], we may suppose that D is non-cyclic, so that by Proposition 5.1, $D = p^2$.

If $p = 7$, then $C(D) = 2^2 \times 7^2$ and $N(D) = (2^2 \times 7^2 : (3 \times 2A_4)) : 2$, so that $N(D)$ has 3 orbits on $\text{Irr}^0(C(D)D/D)$ and \mathbb{B} has three blocks with defect group $D = 7^2$.

If $p = 5^2$, then $C(D) = 5^2 \times S_5$ and $N(D) = 5^2 : 4S_4 \times S_5$, so that $N(D)$ has two orbits on $\text{Irr}^0(C(D)D/D)$ and \mathbb{B} has two blocks with defect group $D = 5^2$.

If $p = 3^2$, then $C(D) = 3^2 \times U_4(3) : 2^2$ and $N(D) = (3^2 : D_8 \times U_4(3) : 2^2) : 2$, so that $N(D)$ has three orbits on $\text{Irr}^0(C(D)D/D)$ and \mathbb{B} has three blocks with defect group $D = 3^2$.

Using the method of central characters, $\text{Irr}(B)$ is as above. If $D(B)$ is cyclic, then $\ell(B)$ is given by [11, p. 387].

If $p = 7$ and $B \in \{B_1, B_2\}$, then the non-trivial elements of $D(B)$ are conjugate in \mathbb{B} , and $C(x) = 7 \times 2 \cdot L_3(4) : 2$ for any $1 \neq x \in D(B)$. It follows that

$$k(B) = \ell(B) + \sum_{b \in \text{Blk}(C(x), B)} \ell(b), \quad (5.11)$$

where $\text{Blk}(C(x), B) = \{b \in \text{Blk}(C(x)) : b^G = B\}$. In particular, for $b \in \text{Blk}(C(x), B)$, $b = B_0(7) \times b'$ for some block $b' \in \text{Blk}(2 \cdot L_3(4) : 2)$ with cyclic defect group 7. Now $C_{2 \cdot L_3(4) : 2}(7) = 7 \times 2^2$, $N_{2 \cdot L_3(4) : 2}(7) = 2^2 \times 7 : 3$, and so $\ell(b) = \ell(b') = \mathcal{W}(b') = 3$. Thus if an outer involution in $(2^2 \times 7^2 : (3 \times 2A_4)) : 2$ stabilizes a root block of B , then $\ell(B) = 27 - 3 = 24$; otherwise, $\ell(B) = 27 - 6 = 21$. We may suppose that $\ell(B_1) = 24$ and $\ell(B_2) = 21$.

If $p = 5$ and B equals B_1 or B_2 , then the non-trivial elements of $D(B)$ are of type $5A$, and $C(5A) = 5 \times \text{HS} : 2$, so that (5.11) holds with $C(x) = 5 \times \text{HS} : 2$ and $b = B_0(5) \times b'$, where $b' \in \text{Blk}(\text{HS} : 2)$ with cyclic defect group 5. Thus $\mathcal{W}(b') = \ell(b') = 4$ as $N_{\text{HS} : 2}(5) = 5 : 4 \times S_5$, and $\ell(B) = 20 - 4 = 16$.

If $p = 3$ and $B \in \{B_1, B_2, B_3\}$, then the non-trivial elements of $D(B)$ are of type $3A$, and $C(3A) = S_3 \times \text{Fi}_{22}:2$, so that $b = B_0(S_3) \times b'$ for some $b' \in \text{Blk}(\text{Fi}_{22}:2)$ with cyclic defect group 3 , where $b \in \text{Blk}(S_3 \times \text{Fi}_{22}:2, B)$. Now

$$C_{\text{Fi}_{22}:2}(3) = 3 \times U_4(3):2^2;$$

$$N_{\text{Fi}_{22}:2}(3) = (S_3 \times U_4(3):2).2; \quad N_{\text{Fi}_{22}:2}(3)/(3 \times U_4(3)) = 2^3.$$

Thus, if an element of $N_{\text{Fi}_{22}:2}(3) \setminus C_{\text{Fi}_{22}:2}(3)$ stabilizes the root block of b' , then $\mathcal{W}(b') = \ell(b') = 2$; otherwise, $\mathcal{W}(b') = \ell(b') = 4$. We may suppose that $\ell(B_i) = k(B_i) - 2 = 9 - 2 = 7$ when $i = 1, 2$ and $\ell(B_3) = k(B_3) - 4 = 9 - 4 = 5$.

If $\ell_p(G)$ is the number of p -regular G -conjugacy classes, then $\ell_7(G) = 165$, $\ell_5(G) = 144$ and $\ell_3(G) = 103$. Thus $\ell(B_0)$ can be calculated by the following equation, due to Brauer:

$$\ell_p(G) = \sum_{B \in \text{Blk}^+(G, p)} \ell(B) + |\text{Irr}^0(G)|, \tag{5.12}$$

where $|\text{Irr}^0(G)|$ is 63, 45 or 9 when p equals 7, 5 or 3.

The set $\text{Irr}(\hat{B})$ is also determined using the method of central characters, and $\ell(\hat{B})$ is given by (5.12) with G replaced by \hat{G} , where $\ell_7(\hat{G}) = 220$, $\ell_5(\hat{G}) = 189$ and $\ell_3(\hat{G}) = 139$. \square

THEOREM 5.3. *Let $G = 2.\mathbb{B}$, and let B be a p -block of G with a non-cyclic defect group. If $p \geq 3$, then the number of B -weights is the number of irreducible Brauer characters of B .*

Proof. We may suppose that p is 3, 5 or 7. If $B = B_0$ or \hat{B} , then

$$\mathcal{W}(B) = \sum_R \mathcal{W}_H,$$

where $R \in \mathcal{R}_0(\mathbb{B}, p)$ with $d(C_{\mathbb{B}}(R)R/R) = 0$, and $H = N = N_{\mathbb{B}}(R)$ or $\hat{N} = N_{2.\mathbb{B}}(R)$, according to whether B equals B_0 or \hat{B} . Thus Theorem 5.3 follows by Lemma 5.2 and Tables 2 and 3.

Suppose that $p = 7$. Then $|\text{Irr}(N_{\mathbb{B}}(7^2)/7^2)| = 69$, \mathbb{B} has sixty-nine weights of the form $(7^2, \varphi)$, twenty-four of which are B_0 -weights. If $b \in \text{Blk}(2^2 \times 7^2)$ is stabilized by an outer involution of $(2^2 \times 7^2:(3 \times 2A_4)):2$, then its canonical character θ is stabilized by $N_{\mathbb{B}}(7^2)$, so θ has an extension to $N_{\mathbb{B}}(7^2)$ and $b^{N_{\mathbb{B}}(7^2)}$ has twenty-four weight characters, which form all twenty-four B_1 -weights. Finally, B_2 has $21 = 69 - 24 - 24$ weights.

If $p = 5$ and B is B_1 or B_2 , then $N_{\mathbb{B}}(D)/C_{\mathbb{B}}(D)D = 4S_4$, which has sixteen irreducible characters, so that B has sixteen weights of the form (D, φ) .

If $p = 3$ and $B \in \{B_1, B_2\}$, then $N_{\mathbb{B}}(D)/C_{\mathbb{B}}(D)D$ is a semidihedral group SD_{16} , so that B has seven weights of the form (D, φ) .

If $p = 3$ and $B = B_3$, then B has five weights of the form (D, φ) , since $N_{\mathbb{B}}(D)/D$ has nineteen irreducible characters of defect 0, and fourteen of these are weight characters of B_1 or B_2 . \square

6. Radical chains

Let $G = \mathbb{B}$, $C \in \mathcal{R}(G)$ and $N(C) = N_G(C)$. We will do some cancellations in the alternating sum of Uno's conjecture. We first list some radical p -chains $C(i)$ and their normalizers for certain integers i , and then reduce the proof of the conjecture to the subfamily $\mathcal{R}^0 = \mathcal{R}^0(G)$ of $\mathcal{R}(G)$, where $\mathcal{R}^0(G)$ is the union of G -orbits of all $C(i)$. The subgroups of the p -chains in Tables 5 and 6 are given either by Tables 2 and 3, or in the proofs of Proposition 5.1 and Lemma 6.1.

LEMMA 6.1. Let $\mathcal{R}^0(G)$ be the G -invariant subfamily of $\mathcal{R}(G)$ such that

$$\mathcal{R}^0(G)/G = \begin{cases} \{C(i) : 1 \leq i \leq 10\} & \text{with } C(i) \text{ given in Table 5 if } p = 5, \\ \{C(i) : 1 \leq i \leq 36\} & \text{with } C(i) \text{ given in Table 6 if } p = 3. \end{cases}$$

Then

$$\sum_{C \in \mathcal{R}(G)/G} (-1)^{|C|} k(N(C), B, d, [r]) = \sum_{C \in \mathcal{R}^0(G)/G} (-1)^{|C|} k(N(C), B, d, [r]). \quad (6.1)$$

Proof. Let $C \in \mathcal{R}(G)$ be given by (2.1), so that we may suppose that $P_1 \in \mathcal{R}_0(G, p)$.

Case (1) Suppose that $p = 5$. If $P_1 = O_5(M_1) = 5$, then $C \in_G \{C(2), C(3), C(4), C(5)\}$, since $\mathcal{R}_0(N_{\mathbb{B}}(5^2), 5) = \{5^2, 5^3\}$.

Let $\sigma : 1 < Q = 5^3 < 5^2 \cdot 5^{1+2}$, so that $\sigma' : 1 < 5^2 \cdot 5^{1+2}$. Thus σ and σ' satisfy the conditions of Lemma 2.1, so there is a bijection g from $\mathcal{R}^-(\sigma, 5^3)$ onto $\mathcal{R}^0(\sigma, 5^3)$ such that $N(C') = N(g(C'))$ and $|C'| = |g(C')| - 1$ for each $C' \in \mathcal{R}^-(\sigma, 5^3)$. So

$$k(N(C'), B, d, [r]) = k(N(g(C')), B, d, [r]), \quad (6.2)$$

and we may suppose that $C \notin (\mathcal{R}^-(\sigma, 5^3) \cup \mathcal{R}^0(\sigma, 5^3))$. In particular, we may suppose that $P_1 \neq_G 5^2 \cdot 5^{1+2}$, and if $P_1 = 5^3$, then $P_2 \neq_G 5^2 \cdot 5^{1+2}$. Similarly, let $C' : 1 < 5^3 < 5^{1+4} < 5^{1+4} \cdot 5$ and $g(C') : 1 < 5^3 < 5^{1+4} \cdot 5$. Then $N(C') = N(g(C'))$ and (6.2) holds; hence, if $P_1 = 5^3 = O_5(M_2)$, we may suppose that $C \in_G \{C(6), C(7)\}$.

Let $C' : 1 < 5^{1+4} < 5^{1+4} \cdot 5$ and $g(C') : 1 < 5^{1+4} \cdot 5$, so that $N(C') = N(g(C')) = 5^{1+4} \cdot 5 \cdot 4^2$ and (6.2) holds. If $P_1 = 5^{1+4}$, then we may suppose that $C =_G C(8)$. If $P_1 = 5^2$, then $C =_G C(9)$ or $C(10)$.

Case (2) Suppose that $p = 3$.

Case (2.1) Let $R \in \mathcal{R}_0(M_1, 3) \setminus \{3^{1+8}\}$ and let $\sigma(R) : 1 < Q = 3^{1+8} < R$, so that $\sigma(R)' : 1 < R$, where $\mathcal{R}_0(M_1, 3)$ is given by (5.3). Then $\sigma(R)$ and $\sigma(R)'$ satisfy the conditions of Lemma 2.1.

Table 5: Some radical 5-chains of \mathbb{B} .

C		$N(C)$
$C(1)$	1	\mathbb{B}
$C(2)$	$1 < 5$	$5:4 \times \text{HS}:2$
$C(3)$	$1 < 5 < 5^2$	$5:4 \times 5:4 \times S_5$
$C(4)$	$1 < 5 < 5^2 < 5^3$	$5:4 \times 5:4 \times 5:4$
$C(5)$	$1 < 5 < 5 \times 5_+^{1+2}$	$5:4 \times 5_+^{1+2} \cdot 4.D_8$
$C(6)$	$1 < 5^3$	$5^3.L_3(5)$
$C(7)$	$1 < 5^3 < 5_+^{1+4}$	$5_+^{1+4}.GL_2(5)$
$C(8)$	$1 < 5_+^{1+4}$	$5_+^{1+4}.2_+^{1+4}.A_5.4$
$C(9)$	$1 < 5^2 < 5^3$	$5^2:4S_4 \times 5:4$
$C(10)$	$1 < 5^2$	$5^2:4S_4 \times S_5$

A similar proof to that of Case (1) shows that we may suppose that

$$C \notin \bigcup_{R \in \mathcal{R}_0(M_1, 3) \setminus \{3^{1+8}\}} (\mathcal{R}^-(\sigma(R), 3^{1+8}) \cup \mathcal{R}^0(\sigma(R), 3^{1+8})).$$

In particular, $P_1 \notin_G \mathcal{R}_0(M_1, 3) \setminus \{3^{1+8}\}$, and if $P_1 = 3^{1+8}$, then $C = C(2)$.

We may suppose that

$$P_1 \in_G \{3, 3^2, 3^6, 3^3 \cdot 3^6, 3^3 \cdot 3 \cdot 3^3 \cdot 3^3, 3^2 \cdot 3^3 \cdot 3^6, 3^2 \cdot 3^3 \cdot 3^6 \cdot 3\}.$$

Case (2.2) Let $\sigma : 1 < Q = 3^2 \cdot 3^3 \cdot 3^6 < 3^2 \cdot 3^3 \cdot 3^6 \cdot 3$, so that $\sigma' : 1 < 3^2 \cdot 3^3 \cdot 3^6 \cdot 3$, where $3^2 \cdot 3^3 \cdot 3^6, 3^2 \cdot 3^3 \cdot 3^6 \cdot 3 \in \mathcal{R}_0(M_2, 3)$ given by (5.4). Then σ and σ' satisfy the conditions of Lemma 2.1. A similar proof to that of Case (1) shows that we may suppose that

$$C \notin (\mathcal{R}^-(\sigma, 3^2 \cdot 2^3 \cdot 3^6) \cup \mathcal{R}^0(\sigma, 3^2 \cdot 2^3 \cdot 3^6)).$$

In particular, $P_1 \neq_G 3^2 \cdot 3^3 \cdot 3^6 \cdot 3$ and if $P_1 = 3^2 \cdot 2^3 \cdot 3^6$, then $P_2 \neq_G 3^2 \cdot 3^3 \cdot 3^6 \cdot 3$.

Let $C' : 1 < 3^2 \cdot 2^3 \cdot 3^6 < S$ and $g(C') : 1 < 3^2 \cdot 2^3 \cdot 3^6 < 3^{1+8} \cdot 3^3 < S$. Then $N(C') = N(g(C')) = S \cdot 2^3$, and so (6.2) holds. Thus if $P_1 = 3^2 \cdot 3^3 \cdot 3^6 = O_3(M_2)$, we may suppose that $C \in_G \{C(3), C(4)\}$.

Case (2.3) Let $C' : 1 < 3^3 \cdot 3^6 < 3^{1+8} \cdot 3^2 \cdot 3$ and $g(C') : 1 < 3^3 \cdot 3^6 < 3^{1+8} \cdot 3^2 < 3^{1+8} \cdot 3^2 \cdot 3$, where $3^{1+8} \cdot 3^2, 3^{1+8} \cdot 3^2 \cdot 3 \in \mathcal{R}_0(M_3, 3)$. Then $N(C') = N(g(C'))$, and (6.2) holds. We may suppose that $C \neq_G C'$ and $C \neq_G g(C')$, so that if $P_1 = 3^3 \cdot 3^6$, we may suppose that $C \in_G \{C(5), C(6), C(7), C(8)\}$.

Case (2.4) Let $C' : 1 < 3^3 \cdot 3 \cdot 3^3 \cdot 3^3 < S$ and $g(C') : 1 < 3^3 \cdot 3 \cdot 3^3 \cdot 3^3 < 3^{1+8} \cdot 3^{1+2} < S$, where $3^3 \cdot 3 \cdot 3^3 \cdot 3^3, 3^{1+8} \cdot 3^{1+2} \in \mathcal{R}_0(M_4, 3)$. Then $N(C') = N(g(C')) = S \cdot 2^3$, and (6.2) holds. We may suppose that $C \neq_G C'$ and $C \neq_G g(C')$, so that if $P_1 = 3^3 \cdot 3 \cdot 3^3 \cdot 3^3$, we may suppose that $C \in_G \{C(9), C(10), C(11), C(12)\}$.

Case (2.5) Let $L = N_{M_5}(3^6) = S_3 \times 3^5 : (2 \times U_4(2) : 2)$. We may take

$$\mathcal{R}_0(L, 3) = \{3^6, 3 \times 3^5 \cdot 3^3, 3 \times 3^5 \cdot 3^{1+2}, 3 \times 3^{1+6} \cdot 3^2\} \subseteq \mathcal{R}_0(M_5, 2),$$

and hence $N_{M_5}(R) \leq N_{M_5}(3^6)$ for all $R \in \mathcal{R}_0(L, 3)$. Let $R \in \mathcal{R}_0(L, 3) \setminus \{3^6\}$ and $\sigma(R) : 1 < 3 < Q = 3^6 < R$, so that $\sigma(R)' : 1 < 3 < R$. A similar proof to that of Case (1) shows that we may suppose that

$$C \notin \bigcup_{R \in \mathcal{R}_0(L, 3) \setminus \{3^6\}} (\mathcal{R}^-(\sigma(R), 3^6) \cup \mathcal{R}^0(\sigma(R), 3^6)).$$

In particular, if $P_1 = 3$, then $P_2 \notin_G \mathcal{R}_0(L, 3) \setminus \{3^6\}$; moreover, if $P_2 = 3^6$, then $C = C(17)$.

Let $H = N_{M_5}(3^2) = S_3 \times (S_3 \times U_4(3) : 2) \cdot 2$. We may take

$$\mathcal{R}_0(H, 3) = \{3^2, 3^6, 3^2 \times 3^{1+4}, 3 \times 3^2 \cdot 3^2 \cdot 3^3\};$$

moreover, $C_{M_5}(3^6) = 3^6$, $C_{M_5}(3^2 \times 3^{1+4}) = C_{M_5}(3 \times 3^2 \cdot 3^2 \cdot 3^3) = 3^3$, and

$$N_H(R) = \begin{cases} S_3 \times S_3 \times 3^4 \cdot 2S_6 & \text{if } R = 3^6, \\ S_3 \times S_3 \times 3^{1+4} \cdot 2_{-}^{1+4} \cdot S_3 & \text{if } R = 3^2 \times 3^{1+4}, \\ S_3 \times 3^2 \cdot 3^2 \cdot 3^3 \cdot 2^3 \cdot 2^2 & \text{if } R = 3 \times 3^2 \cdot 3^2 \cdot 3^3. \end{cases}$$

Let $C' : 1 < 3 < 3^2 < 3 \times 3^2 \cdot 3^2 \cdot 3^3$ and $g(C') : 1 < 3 < 3^2 < 3^2 \times 3^{1+4} < 3 \times 3^2 \cdot 3^2 \cdot 3^3$. Then $N(C') = N(g(C')) = N_H(3 \times 3^2 \cdot 3^2 \cdot 3^3)$ and (6.2) holds. It follows that if $P_1 = 3$ and $P_2 = 3^2$, then we may suppose that $C \in_G \{C(13), C(14), C(15), C(16)\}$.

Conjectures for the Baby Monster

Let $J = N_{M_5}(3 \times 3^{3+3}) = S_3 \times 3^{3+3}:L_3(3)$. We may take

$$\mathcal{R}_0(J, 3) = \{3 \times 3^{3+3}, 3 \times 3^{1+6}.3, 3 \times 3^5:3^{1+2}, 3 \times 3^{1+6}.3^2\} \subseteq \mathcal{R}_0(M_5, 3);$$

moreover, $N_J(3 \times 3^{1+6}.3) = N_{M_5}(3 \times 3^{1+6}.3)$, and

$$N_J(R) = \begin{cases} S_3 \times 3^5:3^{1+2}.2S_4 & \text{if } R = 3 \times 3^5:3^{1+2}, \\ S_3 \times 3^{1+6}.3^2.2^2 & \text{if } R = 3 \times 3^{1+6}.3^2. \end{cases}$$

Let $\sigma : 1 < 3 < Q = 3 \times 3^{3+3} < 3 \times 3^{1+6}.3$, so that $\sigma' : 1 < 3 < 3 \times 3^{1+6}.3$. A similar proof to that of Case (1) shows that we may suppose that

$$C \notin (\mathcal{R}^-(\sigma, 3 \times 3^{3+3}) \cup \mathcal{R}^0(\sigma, 3 \times 3^{3+3})).$$

Let $C' : 1 < 3 < 3 \times 3^{3+3} < 3 \times 3^{1+6}.3^2$ and $g(C') : 1 < 3 < 3 \times 3^{3+3} < 3 \times 3^5:3^{1+2} < 3 \times 3^{1+6}.3^2$. Then $N(C') = N(g(C')) = N_J(3 \times 3^{1+6}.3^2)$ and (6.2) holds. It follows that if $P_1 = 3$ and $P_2 = 3 \times 3^{3+3}$, then we may suppose that $C \in_G \{C(19), C(20)\}$.

Let $K = N_{M_5}(3 \times 3^{1+6}) = S_3 \times 3^{1+6}.2^{3+4}.3^2.2^2$. We may take

$$\mathcal{R}_0(K, 3) = \{3 \times 3^{1+6}, 3 \times 3^{1+6}.3, 3 \times 3^5.3^3, 3 \times 3^{1+6}.3^2\} \subseteq \mathcal{R}_0(M_5, 3);$$

moreover, $N_K(R) = N_{M_5}(R)$ for each $R \in \mathcal{R}_0(K, 3)$.

Let $C' : 1 < 3 < 3 \times 3^{1+6} < 3 \times 3^{1+6}.3^2$ and $g(C') : 1 < 3 < 3 \times 3^{1+6} < 3 \times 3^5.3^3 < 3 \times 3^{1+6}.3^2$. Then $N(C') = N(g(C')) = N_K(3 \times 3^{1+6}.3^2)$ and (6.2) holds. If $P_1 = 3$ and $P_2 = 3 \times 3^{1+6}$, then we may suppose that $C \in_G \{C(21), C(22), C(23), C(24)\}$.

It follows that if $P_1 = 3$, then $C =_G C(i)$ for $13 \leq i \leq 24$

Case (2.6) Let $\sigma : 1 < 3^2 < Q = 3^2 \times 3^{1+4} < 3^3.3^2.3^3$, so that $\sigma' : 1 < 3^2 < 3^3.3^2.3^3$, where $3^3.3^2.3^3, 3^2 \times 3^{1+4} \in \mathcal{R}_0(M_6, 3)$. A similar proof to that of Case (1) shows that we may suppose that

$$C \notin (\mathcal{R}^-(\sigma, 3^2 \times 3^{1+4}) \cup \mathcal{R}^0(\sigma, 3^2 \times 3^{1+4})).$$

In particular, if $P_1 = 3^2$, then $P_2 \neq_G 3^3.3^2.3^3$; if, moreover, $P_2 = 3^2 \times 3^{1+4}$, then $P_3 \neq_G 3^3.3^2.3^3$. Thus we may suppose that $C \in_G \{C(25), C(26), C(27), C(28)\}$.

Case (2.7) Let $T = N_{M_7}(3^{1+8}.3) = N(3^{1+8}.3) = 3^{1+8}.3.2^2.2^4.3^2.D_8$. We may take

$$\mathcal{R}_0(T, 3) = \{3^{1+8}.3, 3^6.3^{2+3}, 3^{3+6}.3^{1+2}\} \subseteq \mathcal{R}_0(M_7, 3);$$

moreover, $N_T(R) = N_{M_7}(R)$ for each $R \in \mathcal{R}_0(T, 3)$.

Let $R \in \mathcal{R}_0(T, 3) \setminus \{3^{1+8}.3\}$, $\sigma(R) : 1 < 3^6 < Q = 3^{1+8}.3 < R$, so that $\sigma(R)' : 1 < 3^6 < R$. A similar proof to that of Case (1) shows that we may suppose that

$$C \notin \bigcup_{R \in \mathcal{R}_0(T, 3) \setminus \{3^{1+8}.3\}} (\mathcal{R}^-(\sigma(R), 3^{1+8}.3) \cup \mathcal{R}^0(\sigma, 3^{1+8}.3)).$$

In particular, if $P_1 = 3^6$, then $P_2 \notin \mathcal{R}_0(T, 3) \setminus \{3^{1+8}.3\}$; if, moreover, $P_2 = 3^{1+8}.3$, then $P_3 \notin \mathcal{R}_0(T, 3)$.

Let $V = N_{M_7}(3^{3+6}) = 3^{3+6}.(2^2 \times L_3(3))$. We may take

$$\mathcal{R}_0(V, 3) = \{3^{3+6}, 3^2.3^3.3^6, 3^6.3^{2+3}, 3^{3+6}.3^{1+2}\} \subseteq \mathcal{R}_0(M_7, 3);$$

moreover,

$$N_V(R) = \begin{cases} 3^2.3^3.3^6.(2^2 \times 2S_4) & \text{if } R = 3^2.3^3.3^6, \\ 3^6.3^{2+3}.(2^2 \times 2S_4) & \text{if } R = 3^6.3^{2+3}, \\ 3^{3+6}.3^{1+2}.2^4 & \text{if } R = 3^{3+6}.3^{1+2}. \end{cases}$$

Conjectures for the Baby Monster

Let $C' : 1 < 3^6 < 3^{3+6} < 3^6.3^{2+3} < 3^{3+6}.3^{1+2}$ and $g(C') : 1 < 3^6 < 3^{3+6} < 3^{3+6}.3^{1+2}$. Then $N(C') = N(g(C')) = N_V(3^{3+6}.3^{1+2})$ and (6.2) holds. If $P_1 = 3^6$ and $P_2 = 3^{3+6}$, then we may suppose that $C \in_G \{C(29), C(30), C(31), C(32)\}$.

Since Sylow 3-subgroups of $N_{M_7}(3^2.3^3.3^6) = 3^2.3^3.3^6.(2 \times 2S_4:2):2$ are the only radical subgroups of $N_{M_7}(3^2.3^3.3^6)$ other than $3^2.3^3.3^6$, it follows that if $P_1 = 3^6$, then $C =_G C(i)$ for some $29 \leq i \leq 36$. \square

REMARK. Let $\hat{G} = 2.\mathbb{B}$ and let ξ be the faithful character of $\text{Irr}(Z(\hat{G}))$ and $\hat{B} \in \text{Blk}(\hat{G})$ covering the block of $B(\xi)$. If $D(\hat{B}) \neq 1$ and $p = 3, 5$, then

$$\sum_{C \in \mathcal{R}(G)/G} (-1)^{|C|} \text{k}(N_{\hat{G}}(C), \hat{B}, d, \xi, [r]) = \sum_{C \in \mathcal{R}^0(G)/G} (-1)^{|C|} \text{k}(N_{\hat{G}}(C), \hat{B}, d, \xi, [r]).$$

The proof of the remark is the same as that of Lemma 6.1, since $N(C') = N(g(C'))$ implies that $N_{\hat{G}}(C') = N_{\hat{G}}(g(C'))$.

7. The proof of Uno's projective conjecture

LEMMA 7.1. Let G be a finite group, and let $B \in \text{Blk}(G)$ with $\text{plr}(B) = 2$ and abelian defect group $D = D(B)$. Let $O_p(G) \neq R < D$ be radical, and let $b \in \text{Blk}(N_G(R))$ with $b^G = B$. Then

$$\text{k}(N_G(R) \cap N_G(D), b, d, \rho, [r]) = \text{k}(N_G(R), b, d, \rho, [r]). \quad (7.1)$$

Proof. Since R is radical and D is abelian, D is a defect group of b , $\text{plr}(b) \neq 0$ and $\text{plr}(b) = 1$. By [3], we see that [3, Conjecture 1.3] holds for b ; that is,

$$\begin{aligned} & \text{k}(N_G(R), b, d, \rho, [r]) - \text{k}(N_G(R) \cap N_G(D), b, d, \rho, [r]) \\ & = w(N_G(R), b, d, \rho, [r], R) - w(N_G(R) \cap N_G(D), b, d, \rho, [r], R), \end{aligned}$$

where $w(H, Q)$ is the number of irreducible characters of H afforded by a Q -projective $\mathcal{O}H$ -module. By [13], if

$$w(N_G(R), b, d, \rho, [r], R) \neq 0 \quad \text{or} \quad w(N_G(R) \cap N_G(D), b, d, \rho, [r], R) \neq 0,$$

then $C_D(R) \leq R$, which is impossible. Thus $w(N_G(R) \cap N_G(D), b, d, \rho, [r], R) = w(N_G(R), b, d, \rho, [r], R) = 0$ and (7.1) holds. \square

Suppose that $\hat{G} = 2.\mathbb{B}$, and that $B \in \text{Blk}(\hat{G})$ with $D(B) \cong p^2$, so that $\text{plr}(B) = 2$. Thus Uno's projective conjecture for B is equivalent to the equation

$$\text{k}(2.\mathbb{B}, B, d, \rho, [r]) = \text{k}(N_{2.\mathbb{B}}(D(B)), B, d, \rho, [r]). \quad (7.2)$$

Note that if ρ is the trivial character, then B is a block of \mathbb{B} .

The tables listing the degrees of the irreducible characters referred to in the proof of Theorems 7.2 and 7.3 are available in Appendix A.

THEOREM 7.2. Let B be a p -block of the Baby Monster $G = \mathbb{B}$ with a positive defect. If p is odd, then B satisfies Uno's ordinary conjecture.

Proof. We may suppose that $D(B)$ is non-cyclic; by Lemma 5.2, $B \in \{B_0, B_1, B_2\}$ when $p = 7, 5$ and $B \in \{B_0, B_1, B_2, B_3\}$ when $p = 3$.

Case (1) If $p = 7$, then $D(B) \cong 7^2$, $N_{\mathbb{B}}(D(B)) \cong (2^2 \times 7^2:(3 \times 2A_4)):2$ and

$$k(\mathbb{B}, B, d, [r]) = k(N(D(B)), B, d, [r]) = \begin{cases} 9 & \text{if } d = 2 \text{ and } r = 1, \\ 9 & \text{if } d = 2 \text{ and } r = 2, \\ 9 & \text{if } d = 2 \text{ and } r = 3, \\ 0 & \text{otherwise.} \end{cases} \quad (7.3)$$

Thus (7.2) holds.

Case (2) Suppose that $p = 5$ and $B = B_1$ or B_2 . Then $D(B) \cong 5^2$, $N(D(B)) = N(C(10)) \cong 5^2:4S_4 \times S_5$ and Theorem 7.2 follows because

$$k(\mathbb{B}, B, d, [r]) = k(N(C(10)), B, d, [r]) = \begin{cases} 10 & \text{if } d = 2 \text{ and } r = 1, \\ 10 & \text{if } d = 2 \text{ and } r = 2, \\ 0 & \text{otherwise.} \end{cases}$$

Suppose that $B = B_0$. Since $N_{\mathbb{B}}(C(3)) \cong 5:4 \times 5:4 \times S_5$, its principal block $b_0 = B_0(N(C(3)))$ has p -local rank one and $N(C(4)) = N(D(b_0))$. Thus (7.1) holds for $b = b_0$ (with $\rho = 1$). Similarly, (7.1) holds for $b_0 = B_0(N(C(10)))$ with $N(C(9)) = N(D(b_0))$, since $N(C(10)) \cong 5^2:4S_4 \times S_5$.

We set $k(i, d, r) = k(N(C(i)), B, d, [r])$ for integers i, d and r . The values $k(i, d, r)$ are given in Table 7.

It follows that

$$\sum_{i=1}^{10} (-1)^{|C(i)|} k(N(C(i)), B_0, d, [r]) = 0.$$

Case (3) Suppose that $p = 3$, so that Uno's projective conjecture is equivalent to Dade's projective conjecture.

If $B = B_1, B_2$ or B_3 , then $N(D(B)) = N(C(28)) \cong (3^2:D_8 \times U_4(3):2^2).2$ and Theorem 7.2 follows because

$$k(\mathbb{B}, B, d) = k(N(C(28)), B, d) = \begin{cases} 9 & \text{if } d = 2, \\ 0 & \text{otherwise.} \end{cases}$$

Table 7: Values of $k(i, d, r)$ when $p = 5$ and $B = B_0$.

Defect d	6	5	5	4	4	3	3	otherwise
Value r	1	1	2	1	2	1	2	otherwise

It follows that

$$\sum_{d(N(C))=13} (-1)^{|C|} k(N(C), B_0, d) = \begin{cases} -9 & \text{if } d = 7, \\ 0 & \text{otherwise.} \end{cases}$$

Theorem 7.2 follows for B_0 . □

THEOREM 7.3. *Let B be a p -block of the covering group $\hat{G} = 2.\mathbb{B}$ of the Baby Monster \mathbb{B} with a positive defect. If p is odd, then B satisfies Uno's projective conjecture.*

Proof. We may suppose that $D(B)$ is non-cyclic, and that $\text{Irr}(B) \not\subseteq \text{Irr}(\mathbb{B})$, so that $B = \hat{B}$.

Case (1) If $p = 7$, then $N_{2.\mathbb{B}}(D(B)) \cong 2.(2^2 \times 7^2:(3 \times 2A_4)):2$. The values of $k(2.\mathbb{B}, B, d, \xi, [r])$ and $k(N_{2.\mathbb{B}}(D(B)), B, d, \xi, [r])$ are the same, and are given by (7.3).

Case (2) Suppose that $p = 5$, so that $N_{2.\mathbb{B}}(C(i))$ has a unique block $\hat{b}(i)$ such that $\hat{b}(i)^{N_{2.\mathbb{B}}(C(i))} = \hat{B}$. By Lemma 7.1, equation (7.1) holds for $b = \hat{b}(10)$ and $\hat{b}(3)$ (with $\rho = \xi$). Set $k(i, d, r) = k(N_{2.\mathbb{B}}(C(i)), \hat{B}, d, \xi, [r])$ for integers i, d and r . The values $k(i, d, r)$ are given in Table 12.

Table 12: Values of $k(i, d, r)$ when $p = 5$ and $B = \hat{B}$.

Defect d	6	5	5	4	4	3	3	otherwise
Value r	2	1	2	1	2	1	2	otherwise
$k(1, d, r)$	25	5	12	0	1	5	1	0
$k(2, d, r) = k(5, d, r)$	0	0	0	11	26	4	9	0
$k(6, d, r)$	25	4	8	0	1	0	1	0
$k(7, d, r)$	25	4	8	4	4	0	1	0
$k(8, d, r)$	25	5	12	4	4	5	1	0

Table 13: Values of $k(i, d)$ when $p = 3$ and $d(N_{2.\mathbb{B}}(C(i))) = 8$.

Defect d	8	7	6	5	otherwise
$k(13, d)$	87	18	27	12	0
$k(14, d)$	87	18	63	12	0
$k(15, d)$	87	42	63	0	0
$k(16, d)$	87	42	27	0	0
$k(25, d)$	57	18	18	0	0
$k(26, d)$	57	18	30	0	0
$k(27, d)$	57	12	30	6	0
$k(28, d)$	57	12	18	6	0

It follows that

$$\sum_{i=1}^{10} (-1)^{|C(i)|} k(N_{2,\mathbb{B}}(C(i)), \hat{B}, d, \xi, [r]) = 0.$$

Case (3) Suppose that $p = 3$, so that Uno's projective conjecture is equivalent to Dade's projective conjecture. Set $k(i, d) = k(N_{2,\mathbb{B}}(C(i)), \hat{B}, d, \xi)$.

Suppose that $C = C(i)$ is a chain with $d(N_{2,\mathbb{B}}(C)) = 8$. Then $13 \leq i \leq 16$ or $25 \leq i \leq 28$, and the values $k(i, d)$ are given in Table 13.

It follows that

$$\sum_{d(N_{2,\mathbb{B}}(C))=8} (-1)^{|C|} k(N_{2,\mathbb{B}}(C), \hat{B}, d, \xi) = 0.$$

Suppose that $C = C(i)$ is a chain with $d(N_{2,\mathbb{B}}(C)) = 10$. Then $17 \leq i \leq 24$ and the values $k(i, d)$ are given in Table 14.

It follows that

$$\sum_{d(N_{2,\mathbb{B}}(C))=10} (-1)^{|C|} k(N_{2,\mathbb{B}}(C), \hat{B}, d, \xi) = 0.$$

Suppose that $C = C(i)$ is a chain with $d(N_{2,\mathbb{B}}(C)) = 12$. Then $5 \leq i \leq 8$ or $29 \leq i \leq 36$, and the values $k(i, d)$ are given in Table 15.

It follows that

$$\sum_{d(N_{2,\mathbb{B}}(C))=12} (-1)^{|C|} k(N_{2,\mathbb{B}}(C), \hat{B}, d, \xi) = \begin{cases} 6 & \text{if } d = 7, \\ 0 & \text{otherwise.} \end{cases}$$

Suppose that $C = C(i)$ is a chain with $d(N_{2,\mathbb{B}}(C)) = 13$. Then $1 \leq i \leq 4$ or $9 \leq i \leq 12$, and the values $k(i, d)$ are given in Table 16.

It follows that

$$\sum_{d(N_{2,\mathbb{B}}(C))=13} (-1)^{|C|} k(N_{2,\mathbb{B}}(C), \hat{B}, d, \xi) = \begin{cases} -6 & \text{if } d = 7, \\ 0 & \text{otherwise.} \end{cases}$$

Theorem 7.3 follows for \hat{B} . □
